Balsakore from Kerfkore

Kerfore products are now available with Balsa wood. **Balsakore** can be used in the Kerfkore bendable and lightweight products to provide a core that is made from FSC Certified material containing no added formaldehyde. This wood is low in density but high in strength to provide a very strong, lightweight, cellulose based core material. Balsa wood is five times lighter than traditional particleboard and fiberboard core materials and three times lighter than lite core plywood materials.

Balsakore products can be used with both cold and hot press laminating processes at normal operating pressure. The core also provides the strength to add fasteners, hinges, and other types of hardware. The edge will machine smoothly and is suitable for use with automatic hot melt edge banders.

Balsakore provides an environmentally friendly product that comes from a rapidly renewable resource. The balsa tree is plantation grown and can be harvested in 6 to 7 years. It can be used with conventional fabrication methods to achieve a strong and durable product that is lightweight and good for our environment.
