Kerfkore –Laminate First and then Bend

Kerfkore is the **ONLY** ¾” thick substrate that can be laminated first with HPL, 2-ply veneer, metal, PVC and other semi rigid materials and then bend into the desired shape down to 3 1/2” radius. Kerfkore is available in **NAF**, fire-rated, and other optional materials.

Kerfkore-Green is CARB compliant and FSC certified. This product also offers LEED credit points.

One sheet of Kerfkore goes a long way! A fabricator can just cut out what he needs and roll the rest up for future use. Kerfkore is still the only product that can be laminated first and THEN bent.

Kerfkore Company, a manufacturer of patented bendable substrates and panel products, offers Kerfkore. Kerfkore enables you to laminate first with HPL metal, veneer and other semi rigid materials and then bend into the desired shape down to 3 ½ ” radius. Kerfkore saves time and improves quality by laminating flat and sanding flat prior to bending. It is dimensionally stable and holds its shape when formed with a series of horizontal ribs. Because of Kerfkore’s unique construction, excess material can be used on other projects virtually eliminating scrap.
